

Lizi Gordiashvili

Computer science student, UCNJ — Summit, New Jersey

I'm a computer science student who likes turning research into things that actually run — AI systems, mostly, but also whatever hardware happens to be lying around. Right now that means an academic advisor for my college, a NASA-funded research project, and a hydroponics rig I wired myself.

Founding and leading Owl, an AI academic advisor for UCNJ students

Researching AI-based lunar infrastructure optimization for NASA's NJ Space Grant Consortium

Studying generative AI censorship and governance, comparing China and the U.S.

PROJECTS & RESEARCH

Owl — AI Academic Advisor

Aug 2026 – present

Founder & team lead, UCNJ Smart AI Assistant Initiative

I started this project myself: an AI-powered academic advisor for UCNJ students, built from the ground up. I recruited and now lead a five-person research team, and I'm the one who approached a UCNJ professor to ask them to mentor it. We're past the concept stage now — I set the research direction and we're working through an active prototype together.

AI-Based Lunar Infrastructure Optimization

Sept 2026 – present

Research intern, NJ Space Grant Consortium (NASA-sponsored)

Researching and building an AI-based optimization system to help design sustainable infrastructure for future lunar missions — using computational modeling to weigh cost and mission risk against real infrastructure constraints, funded through NASA's New Jersey Space Grant Consortium.

Generative AI Censorship & Governance

Sept 2026 – present

Student researcher (compensated), UCNJ Independent Research Group

A comparative research project on how generative AI systems get censored and moderated differently in China versus the United States. I analyze model outputs, corporate policy, and regulatory frameworks, under faculty supervision, to understand how national governance actually shapes AI behavior.

IoT Hydroponic Monitoring System

May – Aug 2026

Software development intern, NJ Pathways to Agribusiness Internship

Built a hydroponic monitoring system from the hardware up. I programmed an ESP32 microcontroller to read live environmental and water-quality sensors and send data wirelessly over MQTT, then configured a Raspberry Pi as a local server running a full pipeline — MQTT, Node-RED, InfluxDB, and Grafana — to process, store, and visualize the readings on live dashboards. I also wired, soldered, and calibrated the hardware myself, pH and EC sensors included.

ESP32, MQTT, Raspberry Pi, Node-RED, InfluxDB, Grafana

TEACHING & COMMUNITY

STEM Tutor

May 2026 – present

UCNJ Academic Learning Center (ALC)

I build personalized STEM lesson plans and adjust how I teach to how each student actually learns, using educational technology where it helps rather than for its own sake.

Volunteer

May – Sept 2024

SHIP — Summit Helping Its People

Prepared and served meals to community members in need, and helped set up and run the soup kitchen.

SKILLS

Technical

Java, Python, C++, Linux

Also

Research design & methodology, data analysis, problem solving, team leadership, curriculum development, educational technology
